Real Results: How Customers Use the Full EnergyCAP Suite to Drive Impact

Beth Calehuff
Senior Manager,
CAPture Services

Mike Hoffman
Energy Manager,
University of Arizona

The journey

- ✓ About University of Arizona
- ✓ Life before EnergyCAP
- ✓ Why EnergyCAP?
- ✓ Wrangling data: Interval data and utility bills
- ✓ Addressing complex cost allocation
- ✓ Secrets to success
- ✓ Wrap up – feel free to ask questions along the way!

About University of Arizona

The University's utility data portfolio is complex

- Diverse energy sources
 - Electricity, natural gas, chilled water, steam, solar, and water systems across a vast campus footprint
- Multiple providers and rates
 - 14 different utility vendors
- Data volume and granularity
 - More than 1,000 meters
 - 80 unique utility rates
- Operational and financial impacts
 - Utility data influences budget, sustainability goals, and operational priorities

Critical to energy management goals and sustainability efforts are

About University of Arizona

The University's utility
data portfolio is
complex

Diverse energy sources

- Electricity, natural gas, chilled water, steam, solar, and water systems across a vast campus footprint

Multiple providers and rates

- 14 different utility vendors

Data volume and granularity

- More than 1,000 meters
- 80 unique utility rates

Operational and financial impacts

- Utility data influences budget, sustainability goals, and operational priorities

Critical to energy management goals and sustainability efforts are

- Cost control
- Efficiency
- Data accuracy

Life before EnergyCAP

Outdated systems

- Single SME responsible for managing submetering data
- Intensive manual labor

Limited analysis

- 19+ years of data in spreadsheets
- Created tools with Excel for analysis
- Limited cost tracking and analysis

Lack of system integration

- Energy data siloed from financial and accounting systems

Why EnergyCAP?

To achieve critical time and cost savings, the University of Arizona needed an automated system to scale.

- 100% control of our utility data
- Quality data
- The current process was labor intensive
- Integration to A/P and easily pay bills
- Cost-saving opportunities
- Comprehensive chargebacks and bill splitting
- Repeatable workflows
- Make data-driven decisions

Energy data at your fingertips

M&V

- Option B vs Option C
- Submeter data

Interval data

- Tracking actual use

Reporting and sharing data

- Automated reporting
- At-a-glance answers

Single source of truth

- Bill CAPture to get data into the system
- Finance and energy management work from the same dataset

Energy Use Intensity

Chargebacks

1

Start with electric meters

Workflows organize groups of bill splits and calculations into repeatable steps so the same process is followed every month

2

Calculate chilled water and steam

3

Calculate water and sewer

4

Calculate summary meters and split

Allocate use and cost by dividing a bill into smaller bills, or create a new bill based on submeter readings

Implementation outcomes

Save time

Bill CAPture processed more than 1,800 bills to date

Ad-hoc reporting

Automated processes

Customizable dashboards

- Share progress internally and externally

Save cost

Flag and address

Unusual use, cost, and demand

Billing errors, late fees, overlapping charges

- Easy cost avoidance calculations

Make an impact

Visibility into utility spend across buildings, vendors, and commodities

Well established documentation

Even more to come with accounting integration

Secrets to success
